Mice lifetimes

Simple hypothesis

Consider the one-way ANOVA model: $Y_{ij} \sim N(\mu_j, \sigma^2)$ where $j = 1, \dots, J$.

Here are a few simple alternative hypotheses:

- ① Mean lifetimes for N/R50 and R/R50 diet are different.
- ② Mean lifetimes for N/R40 is different than for N/R50 and R/R50 combined.
- ③ Mean lifetimes for high calorie (NP and N/N85) diets is different than for low calorie diets combined.

$$H_0 : \gamma = 0 \quad H_1 : \gamma \neq 0 :$$

$$\gamma_1 = \mu_{R/R50} - \mu_{N/R50}$$

$$\gamma_2 = \mu_{N/R40} - \frac{1}{2}(\mu_{N/R50} + \mu_{R/R50})$$

$$\gamma_3 = \frac{1}{4}(\mu_{N/R50} + \mu_{R/R50} + \mu_{N/R40} + \mu_{lopro}) - \frac{1}{2}(\mu_{NP} + \mu_{N/N85})$$

Contrasts

Definition

A **linear combination** of group means has the form

$$\gamma = C_1\mu_1 + C_2\mu_2 + \dots + C_J\mu_J$$

where C_j are known coefficients and μ_j are the unknown population means.

Definition

A linear combination with $C_1 + C_2 + \dots + C_J = 0$ is a **contrast**.

Remark Contrast interpretation is usually best if

$|C_1| + |C_2| + \dots + |C_J| = 2$, i.e. both the positive and negative coefficients sum to 1.

Inference on contrasts

$$\gamma = C_1\mu_1 + C_2\mu_2 + \cdots + C_J\mu_J$$

Estimated by

$$g = C_1\bar{Y}_1 + C_2\bar{Y}_2 + \cdots + C_J\bar{Y}_J$$

with standard error

$$SE(g) = s_p \sqrt{\frac{C_1^2}{n_1} + \frac{C_2^2}{n_2} + \cdots + \frac{C_J^2}{n_J}}$$

t-statistic (compare to t_{n-J}) and CI:

$$t = \frac{g}{SE(g)} \quad g \pm t_{n-J}(1 - \alpha/2)SE(g)$$

Contrasts for mice lifetime dataset

For these contrasts:

- ① Mean lifetimes for N/R50 and R/R50 diet are different.
- ② Mean lifetimes for N/R40 is different than for N/R50 and R/R50 combined.
- ③ Mean lifetimes for high calorie (NP and N/N85) diets is different than for low calorie diets combined.

$$H_0 : \gamma = 0 \quad H_1 : \gamma \neq 0 :$$

$$\gamma_1 = \mu_{R/R50} - \mu_{N/R50}$$

$$\gamma_2 = \mu_{N/R40} - \frac{1}{2}(\mu_{N/R50} + \mu_{R/R50})$$

$$\gamma_3 = \frac{1}{4}(\mu_{N/R50} + \mu_{R/R50} + \mu_{N/R40} + \mu_{lopro}) - \frac{1}{2}(\mu_{NP} + \mu_{N/N85})$$

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

(Adjusted p values reported -- single-step method)

```
confint(t, calpha=univariate_calpha())
```

Simultaneous Confidence Intervals

Fit: `lm(formula = Lifetime ~ Diet - 1, data = case0501)`

Quantile = 1.967

95% confidence level

Linear Hypotheses:

	Estimate	lwr	upr
early rest - none @ 50kcal == 0	0.589	-1.759	2.936
40kcal/week - 50kcal/week == 0	2.525	0.463	4.588
lo cal - hi cal == 0	12.450	10.915	13.984

Summary

- Contrasts are linear combinations that sum to zero
- t-test tools are used to calculate pvalues and confidence intervals
