Mice lifetimes

Simple hypothesis

Consider the one-way ANOVA model: $Y_{ij} \sim N(\mu_j, \sigma^2)$ where $j = 1, \dots, J$.

Here are a few simple alternative hypotheses:

- Mean lifetimes for N/R50 and R/R50 diet are different.
- Mean lifetimes for N/R40 is different than for N/R50 and R/R50 combined.
- Mean lifetimes for high calorie (NP and N/N85) diets is different than for low calorie diets combined.

$$H_0: \gamma = 0$$
 $H_1: \gamma \neq 0:$
$$\gamma_1 = \mu_{R/R50} - \mu_{N/R50}$$

$$\gamma_2 = \frac{1}{2}(\mu_{N/R50} + \mu_{R/R50}) - \mu_{N/R40}$$

$$\gamma_3 = \frac{1}{2}(\mu_{NP} + \mu_{N/N85}) - \frac{1}{4}(\mu_{N/R50} + \mu_{R/R50} + \mu_{N/R40} + \mu_{lopro})$$

Contrasts

Definition

A linear combination of group means has the form

$$\gamma = C_1 \mu_1 + C_2 \mu_2 + \ldots + C_J \mu_J$$

where \mathcal{C}_j are known coefficients and μ_j are the unknown population means.

vspace0.2in

Definition

A linear combination with $C_1 + C_2 + \cdots + C_J = 0$ is a contrast.

Remark Contrast interpretation is usually best if $|C_1| + |C_2| + \cdots + |C_J| = 2$, i.e. both the positive and negative coefficients sum to 1.

Inference on contrasts

$$\gamma = C_1 \mu_1 + C_2 \mu_2 + \dots + C_J \mu_J$$

Estimated by

$$g = C_1 \overline{Y}_1 + C_2 \overline{Y}_2 + \dots + C_J \overline{Y}_J$$

with standard error

$$SE(g) = s_p \sqrt{\frac{C_1^2}{n_1} + \frac{C_2^2}{n_2} + \cdots + \frac{C_J^2}{n_J}}$$

t-statistic (compare to t_{n-J}) and CI:

$$t = \frac{g}{SE(g)}$$
 $g \pm t_{n-J}(1 - \alpha/2)SE(g)$

Contrasts for mice lifetime dataset

For these contrasts:

- Mean lifetimes for N/R50 and R/R50 diet are different.
- Mean lifetimes for N/R40 is different than for N/R50 and R/R50 combined.
- Mean lifetimes for high calorie (NP and N/N85) diets is different than for low calorie diets combined.

$$H_0: \gamma = 0$$
 $H_1: \gamma \neq 0:$

$$\begin{array}{ll} \gamma_1 &= \mu_{R/R50} - \mu_{N/R50} \\ \gamma_2 &= \frac{1}{2} (\mu_{N/R50} + \mu_{R/R50}) - \mu_{N/R40} \\ \gamma_3 &= \frac{1}{2} (\mu_{NP} + \mu_{N/N85}) - \frac{1}{4} (\mu_{N/R50} + \mu_{R/R50} + \mu_{N/R40} + \mu_{lopro}) \end{array}$$
