## R07 - Contrasts

STAT 401 (Engineering) - Iowa State University

April 9, 2018

# Simple hypothesis

Consider the one-way ANOVA model:  $Y_{ij} \stackrel{ind}{\sim} N(\mu_j, \sigma^2)$  where  $j=1,\ldots,J$ .

Here are a few simple alternative hypotheses:

- 1. Mean lifetimes for N/R50 and R/R50 diet are different.
- 2. Mean lifetimes for N/R40 is different than for N/R50 and R/R50 combined.
- 3. Mean lifetimes for high calorie (NP and N/N85) diets is different than for low calorie diets combined.

$$H_0: \gamma = 0$$
  $H_1: \gamma \neq 0:$  
$$\gamma_1 = \mu_{R/R50} - \mu_{N/R50}$$
 
$$\gamma_2 = \mu_{N/R40} - \frac{1}{2}(\mu_{N/R50} + \mu_{R/R50})$$
 
$$\gamma_3 = \frac{1}{4}(\mu_{N/R50} + \mu_{R/R50} + \mu_{N/R40} + \mu_{lopro}) - \frac{1}{2}(\mu_{NP} + \mu_{N/N85})$$

### Contrasts

#### Definition

A linear combination of group means has the form

$$\gamma = C_1 \mu_1 + C_2 \mu_2 + \ldots + C_J \mu_J$$

where  $C_j$  are known coefficients and  $\mu_j$  are the unknown population means.

#### Definition

A linear combination with  $C_1 + C_2 + \cdots + C_J = 0$  is a contrast.

**Remark** Contrast interpretation is usually best if  $|C_1| + |C_2| + \cdots + |C_J| = 2$ , i.e. the positive coefficients sum to 1 and the negative coefficients sum to -1.

### Inference on contrasts

Contrast

$$\gamma = C_1 \mu_1 + C_2 \mu_2 + \dots + C_J \mu_J$$

Estimated by

$$g = C_1 \overline{Y}_1 + C_2 \overline{Y}_2 + \dots + C_J \overline{Y}_J$$

with standard error

$$SE(g) = \hat{\sigma}\sqrt{\frac{C_1^2}{n_1} + \frac{C_2^2}{n_2} + \dots + \frac{C_J^2}{n_J}}$$

t-statistic (compare to  $t_{n-J}$ ) and CI:

$$t = \frac{g}{SE(g)}$$
  $g \pm t_{n-J,1-\alpha/2}SE(g)$ 

## Contrasts for mice lifetime dataset

#### For these contrasts:

- 1. Mean lifetimes for N/R50 and R/R50 diet are different.
- 2. Mean lifetimes for N/R40 is different than for N/R50 and R/R50 combined.
- 3. Mean lifetimes for high calorie (NP and N/N85) diets is different than for low calorie diets combined.

$$H_0: \gamma = 0 \qquad H_1: \gamma \neq 0:$$

$$\begin{array}{ll} \gamma_1 &= \mu_{R/R50} - \mu_{N/R50} \\ \gamma_2 &= \mu_{N/R40} - \frac{1}{2} (\mu_{N/R50} + \mu_{R/R50}) \\ \gamma_3 &= \frac{1}{4} (\mu_{N/R50} + \mu_{R/R50} + \mu_{N/R40} + \mu_{lopro}) - \frac{1}{2} (\mu_{NP} + \mu_{N/N85}) \end{array}$$

## Summary

- Contrasts are linear combinations of means where the coefficients sum to zero
- t-test tools are used to calculate pvalues and confidence intervals

(STAT401@ISU) R07 - Contrasts April 9, 2018 9 / 25

## Sulfur effect on scab disease in potatoes

The experiment was conducted to investigate the effect of sulfur on controlling scab disease in potatoes. There were seven treatments: control, plus spring and fall application of 300, 600, 1200 lbs/acre of sulfur. The response variable was percentage of the potato surface area covered with scab averaged over 100 random selected potatoes. A completely randomized design was used with 8 replications of the control and 4 replications of the other treatments.

Cochran and Cox. (1957) Experimental Design (2nd ed). pg96 and Agron. J. 80:712-718 (1988)

### Scientific question:

- Does sulfur have any impact at all?
- What is the difference between spring and fall application of sulfur?
- What is the effect of increased sulfur application?

(STAT401@ISU) R07 - Contrasts April 9, 2018 17 / 25

## Model

 $Y_{ij}$ : avg % of surface area covered with scab for plot i in treatment j for  $j=1,\ldots,7$ .

Assume  $Y_{ij} \stackrel{ind}{\sim} N(\mu_j, \sigma^2)$ .

### Hypotheses:

- Difference amongst any means: One-way ANOVA F-test
- Any effect: Control vs sulfur
- Fall vs spring: Contrast comparing fall vs spring applications
- Sulfur level: Linear trend contrast

### Contrasts

• Sulfur effect: Any sulfur vs none

$$\gamma = \frac{1}{6}(\mu_{F12} + \mu_{F6} + \mu_{F3} + \mu_{S3} + \mu_{S6} + \mu_{S12}) - \mu_O$$
$$= \frac{1}{6}(\mu_{F12} + \mu_{F6} + \mu_{F3} + \mu_{S3} + \mu_{S6} + \mu_{S12} - 6\mu_O)$$

• Fall vs spring: Contrast comparing fall vs spring applications

$$\gamma = \frac{1}{3}(\mu_{F12} + \mu_{F6} + \mu_{F3}) + 0\mu_O - \frac{1}{3}(\mu_{S3} + \mu_{S6} + \mu_{S12})$$
$$= \frac{1}{3}[1\mu_{F12} + 1\mu_{F6} + 1\mu_{F3} + 0\mu_O - 1\mu_{S3} - 1\mu_{S6} - 1\mu_{S12}]$$

# Contrasts (cont.)

- Sulfur linear trend
  - The group sulfur levels  $(X_j)$  are 12, 6, 3, 0, 3, 6, and 12 (100 lbs/acre)
  - ullet and a linear trend contrast is  $X_j-\overline{X}$

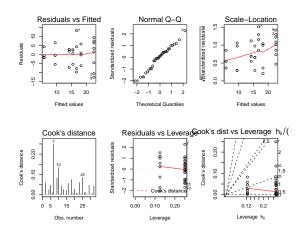

$$\gamma = 6\mu_{F12} + 0\mu_{F6} - 3\mu_{F3} - 6\mu_O - 3\mu_{S3} + 0\mu_{S6} + 6\mu_{S12}$$

## Summary

### For this particular data analysis

- Significant differences in means between the groups (ANOVA  $F_{6,25}=3.61~{
  m p=0.01})$
- ullet Having sulfur was associated with a reducted scab % of 9 (4,15) compared to no sulfur
- Fall application reduced scab % by 6 (0.5,12) compared to spring application
- Linear trend in sulfur was significant (p=0.01)
- Concerned about spatial correlation among columns
- Consider a transformation of the response
  - CI for F12 (-1.2, 12.7) (not shown)
  - Non-constant variance (residuals vs predicted, sulfur, application)
